Importing libraries

```python
#model
import tensorflow as tf
from sklearn.model_selection import train_test_split

#nlp processing
import unicodedata
import re
import numpy as np
import pandas as pd

import warnings
warnings.filterwarnings('ignore')
```

Data pre-processing

The basic text processing in NLP are:

1. Sentence Segmentation
2. Normalization
3. Tokenization

1.Segmentation

```python
#reading data
data=open('/kaggle/input/simple-dialogs-for-chatbot/dialogs.txt','r').read()
```

```python
#paried list of question and corresponding answer
QA_list=[QA.split('\t') for QA in data.split('\n')]
print(QA_list[:5])
```

Output:

[['hi, how are you doing?', "i'm fine. how about yourself?"], ["i'm fine. how about yourself?", "i'm pretty good. thanks for asking."], ["i'm pretty good. thanks for asking.", 'no problem. so how have you been?'], ['no problem. so how have you been?', "i've been great. what about you?"], ["i've been great. what about you?", "i've been good. i'm in school right now."]]

```python
questions=[row[0] for row in QA_list]
answers=[row[1] for row in QA_list]
print(questions[0:5])
print(answers[0:5])
```

Output:

['hi, how are you doing?', "i'm fine. how about yourself?", "i'm pretty good. thanks for asking.", 'no problem. so how have you been?', "i've been great. what about you?"]
["i'm fine. how about yourself?", "i'm pretty good. thanks for asking.", 'no problem. so how have you been?', "i've been great. what about you?", "i've been good. i'm in school right now."]

2.Normalization

```python
def remove_diacritic(text):
    return ''.join(char for char in unicodedata.normalize('NFD',text)
            if unicodedata.category(char) !='Mn')
```

```python
def preprocessing(text):

    #Case folding and removing extra whitespaces
    text=remove_diacritic(text.lower().strip())

    #Ensuring punctuation marks to be treated as tokens
    text=re.sub(r"([?.!,¿])", r" \1 ", text)

    #Removing redundant spaces
    text= re.sub(r'[" "]+', " ", text)

    #Removing non alphabetic characters
    text=re.sub(r"[^a-zA-Z?.!,¿]+", " ", text)

    text=text.strip()

    #Indicating the start and end of each sentence
    text='<start> ' + text + ' <end>'

    return text
```

```python
preprocessed_questions=[preprocessing(sen) for sen in questions]
preprocessed_answers=[preprocessing(sen) for sen in answers]

                                    padding='post')

    return tensor
```

Training Model

1. Pass the input through the encoder which return encoder output and the encoder hidden state.
2. The encoder output, encoder hidden state and the decoder input (which is the start token) is passed to the decoder.
3. The decoder returns the predictions and the decoder hidden state.
4. The decoder hidden state is then passed back into the model and the predictions are used to calculate the loss.
5. Use teacher forcing to decide the next input to the decoder.
6. Teacher forcing is the technique where the target word is passed as the next input to the decoder.
7. The final step is to calculate the gradients and apply it to the optimizer and backpropagate.

```python
optimizer = tf.keras.optimizers.Adam()
loss_object = tf.keras.losses.SparseCategoricalCrossentropy(
    from_logits=True, reduction='none')

def loss_function(real, pred):
    mask = tf.math.logical_not(tf.math.equal(real, 0))
    loss_ = loss_object(real, pred)

    mask = tf.cast(mask, dtype=loss_.dtype)
    loss_ *= mask

    return tf.reduce_mean(loss_)
```

```python
@tf.function
def train_step(inp, targ, enc_hidden):
    loss = 0

    with tf.GradientTape() as tape:
        enc_output, enc_hidden = encoder(inp, enc_hidden)

            dec_input = tf.expand_dims(targ[:, t], 1)

    batch_loss = (loss / int(targ.shape[1]))

    variables = encoder.trainable_variables + decoder.trainable_variables

    gradients = tape.gradient(loss, variables)

    optimizer.apply_gradients(zip(gradients, variables))

    return batch_loss

        batch_loss = train_step(inp, targ, enc_hidden)

3.Creating web using flask:

```python
def chatbot_response(text):

    result, sentence = evaluate(text)

    return result
```

```python
from flask import Flask, render_template, request

app = Flask(__name__)
app.static_folder = 'static'

@app.route("/")
def home():
    return render_template("index.html")

@app.route("/get")
def get_bot_response():
    userText = request.args.get('msg')
    return chatbot_response(userText)

if __name__ == "__main__":
    app.run()
```

Output:

```
